WVDEP-AMLR

EOI - N1

1.0 BACKGROUND

Tetra Tech has extensive experience in the remediation of both active and abandoned mine sites and in the completion of all types of Civil/Mining Engineering projects. Tetra Tech has a mining group headquartered in Pittsburgh, Pennsylvania with satellite offices in West Virginia and Ohio with staff committed to developing, designing, overseeing, and completing mine reclamation projects in the Appalachian region. This group has twenty-one experienced staff including eight engineers and technical staff who formerly worked for state AML programs or OSM and numerous other staff who have completed abandoned mine reclamation projects similar to those that West Virginia is proposing to undertake. This group is headed by Eric Cavazza who worked for Pennsylvania's AML Program for 36+ years and who served as the program director from the beginning of 2012 until the end of 2020. Staff in the group have completed numerous reclamation designs in Pennsylvania, Maryland, Ohio, West Virginia, and Kentucky. Tetra Tech has experts in all phases of AML work from initial site investigations through design and permitting and construction management. Tetra Tech has a similar mining group in the west based primarily out of the Denver, Colorado area with many very experienced staff who have worked and designed numerous AML projects. If needed, those staff can be consulted or brought in to assist with any unique or difficult AML project sites.

Based on the anticipated workload associated with this expression of interest, the mining group staff will lead the projects and also utilize local Tetra Tech staff from our West Virginia office locations. This group is very experienced and should be sufficient to undertake and complete the projects. However, if Tetra Tech's workload changes or the WV DEP's support need increases, we can recruit staff from other groups in Pittsburgh or other Tetra Tech offices and locations to support these projects as needed. Tetra Tech has over 27,000 employees corporate-wide, and many with mining and abandoned mine experience that we have access to. We will also add staff, especially locally in West Virginia, to support these projects if necessary. West Virginia will have the advantage of working with a small group of highly experienced AML staff for projects while knowing that for any unique, difficult, or challenging projects that come up, we have access to a wide variety of experts which can be consulted as needed to deliver the project results WV DEP is seeking. These resources will enable Tetra Tech to complete assigned work in the time required. With our highly experienced staff, many with state AML program experience, we believe we can serve as an extension of your staff – able to hit the ground running to get these important projects completed for West Virginia.

Upon receipt of the formal notice to proceed, Tetra Tech would attend an on-site project kick-off meeting at the site with WVDEP personnel to discuss the project issues and work plan to reach a consensus on the technical approach for the site. The kick-off meeting would also provide the opportunity for WVDEP personnel to express to Tetra Tech their concerns, objectives, and initial thoughts on the project. Upon completion of the on-site project kick-off

meeting a *Document of Understanding* will be prepared by Tetra Tech for the Project Area for review and input by WVDEP to create a work plan and goal-oriented document for the project.

Base mapping will be required for the project. It is Tetra Tech's assumption the mapping will be provided for the project, in which case, some additional checks, spot locations, and potential additional feature items may be required to be located for design purposes. If the base mapping is to be developed by Tetra Tech, a sub-contract surveying company will be utilized for these services.

Based on the initial and available information, a preliminary conceptual plan will be prepared for review by WVDEP personnel. The preliminary conceptual plan will identify the general layout of the site, specific issues identified, proposed water routing, areas of additional concern and in the case of land stability issues, soil borehole locations associated with the proposed geotechnical investigation. A geotechnical sampling plan will be developed for the site in order to address issues identified by the WVDEP/Tetra Tech team members. The soil sampling will be conducted, and appropriate testing will be performed by Tetra Tech's in-house soils laboratory. For open portals, sites will be evaluated for potential bat habitat and, if warranted, bat surveys will be subcontracted. For management and control of underground mine pools, monitoring wells may be necessary. Once detailed information on the nature and extent of the mine pool is determined, the pool may be managed and controlled via pumping, gravity drains, wet seals, horizontal and directional bores, or other means.

All aspects of the project will comply with Infrastructure Investment Jobs Act (IIJA) including compliance with Davis-Bacon and Build America, Buy America (BABA), as applicable and all federal, State and Local Laws.

2.0 CONTRACT WIDE TASKS

Within this contract there are several tasks which will need to be addressed for all of the projects. Those tasks are outlined below.

2.1 PLANNING TASK

Tetra Tech will use OSMRE REG-1, Handbook on Procedures for Implementing the National Environmental Policy Act (NEPA Handbook) (Revised 2019). Depending on the significance of the actual and potential impacts of the proposed project, one of three potential analytical approaches under NEPA may apply: 1) Categorical Exclusion (CE); 2) Environmental Assessment (EA), which may result in a Finding of No Significant Impact (FONSI) or a Notice

of Intent (NOI) to prepare an Environmental Impact Statement (EIS); 3) Environmental Impact Statement (EIS) and Record of Decision (ROD).

Tetra Tech will also coordinate the project with various different agencies to ensure that no adverse effect is seen. This includes consultations with West Virginia Division of Natural Resources (WVDNR), West Virginia Historic Preservation Office (SHPO), WV Regional Planning, US Forest Service, and US Fish and Wildlife Services (USFWS). Based on the results of these consultations additional studies may be needed, this may include but is not limited to bat studies, threatened and endangered species investigation, water quality sampling, and data collection/analysis.

2.2 REALTY TASK

Tetra Tech will research legal ownership of properties by conducting a thorough search of deed records at the county courthouse and provide legal documentation to substantiate legal ownership findings (if required). Tetra Tech will obtain all required exploratory rights of entry (EROE) and construction rights of entry (CROE) for each project as required.

2.3 PERMITTING TASK

Tetra Tech will prepare and submit to obtain the required permits as determined at the Pre-Design Meeting. Required permit applications will be prepared for submittal for the project. All required plans, specifications and required additional data will be included within the application. Required permits may include the following:

- 401/404 Stream and Wetland Permits
- Construction Stormwater General Permit
- WVDOH Occupancy Permit (Driveway Permit)
- NPDES Modification
- Any other local, state, or federal permit identified as being required for the project.

2.4 CONSTRUCTION OVERSITE TASK

Tetra Tech will provide a qualified resident project representative, QA/QC certification, and prepare daily field activity logs summarizing construction activities.

3.0 PROJECT SPECIFIC APPROACHES

Each project is unique and has its own challenges. Outlined below is Tetra Tech's general approach for each project and AML problem type.

3.1 ENTERPRISE PORTAL

This project is located directly north of the town of Enterprise in Harrison County, WV, off Route 19. The goal of this project is the remediation of multiple open and collapsed portals, drainage design, removal of a dangerous existing structure and creation/upgrading the access roads to maintain above.

3.1.1 Remediation of Mine Portals

Tetra Tech has extensive experience in the development and design of mine portal seals. Designs have included drilling from a location above and at an angle from the proposed seal and injecting designed grout to form the seal blockage and have also utilized polyurethane foam as a portal seal. This technique of designing and developing the portal seal has proven to be more effective and safer than excavating at the portal entry location and then constructing the concrete or concrete block portal seal. Each mine portal, whether open or collapsed, will be evaluated to determine the best method for reclamation. All mine portals will be sealed in accordance with WVDEP approved methods. If endangered species are present, such as various bat species, appropriate bat gates or other structures will be incorporated into the project design. Although it is Tetra Tech's understanding, based on information provided by Mike Sheehan, former WVDEP AML&R Program Administrator and current Tetra Tech employee, that the WVDEP's practice for mine openings is to presume presence of endangered bat species. Therefore, appropriate bat gates or other structures will be incorporated into the project design unless instructed otherwise by the WVDEP.

3.1.2 Drainage Design

Drainage areas within the project area will be determined. If possible, diversion ditches will be located in the upstream area in order to control and divert the drainage around the project area. All drainage ditches, swales, underdrains and culverts will be sized and designed in accordance with standard engineering practices. Size, slope, and lining of the proposed ditches and culverts will be specified on the plans and be based on required storm events. Design of drainage conveyances, including drainage channels, underdrains and /or other controls to safely convey water off-site will be designed in accordance with standard engineering practices and will fully consider the safety of the existing public dwellings and structures near the project areas. Hydrologic and hydraulic (H&H) analyses will be performed for the site and existing structures. The HydroCAD Stormwater Modeling program will be utilized in analyzing and sizing drainage structures for the project.

3.1.3 Structure Demolition

Unless directed otherwise by the WVDEP any materials that can be safely and legally buried on-site will be disposed of in this manner, all other materials must be hauled to an appropriate landfill for disposal, weight tickets from the landfill will be required. Derelict equipment shall be hauled off-site and scrapped. If any structures contain asbestos, they will be evaluated in accordance with National Emission Standards for Hazardous Air Pollutants (NESHAP) standards and in accordance with any state or local requirements. Removal of asbestos will be completed in accordance with all safety precautions and requirements.

3.1.4 Access Road Design

Temporary and permanent access will be designed utilizing AutoCad software. Plan view, designed profile, and roadway cross sections shown at an appropriate interval will be prepared and will be included within the final drawing package. Typical sections will be shown to indicate design features such as roadway cross slopes, pavement composition (gravel, asphalt, or concrete) and thickness, side slopes of embankments/cut slopes and proposed ditching. The roadway will be designed in accordance with WVDEP mining and reclamation standards, or other standards as determined by WVDEP. Final design of the roadway will attempt to design the roadway to a balanced cut/fill situation, if possible. Cut and fill quantities will be listed on the plans.

3.2 GLOSSER/WILLIAMS PROPERTY

This project is located west of the town of Meadowbrook in Harrison County, WV. The goal of this project is remediation of a mine pool that is seeping into yards and basements, drainage design and creation/upgrading the access roads to maintain above.

3.2.1 Mine Pool Remediation

Any and all mine mapping and any available geographic information which is available will be compiled and analyzed. Additional geographic information may need to be collected to better understand the mine pool and the best ways to handle the mine pool seepage. Monitoring wells may be installed to complete this task. Depending on the nature and depth of the mine pool a plan will be developed to best handle the water. Once detailed information on the nature and extent of the mine pool is determined, the pool may be managed and controlled via pumping, gravity drains, wet seals, horizontal and directional bores, or other means. In some cases, where there is little risk of mine pool blowout, seepage and drainage may be collected and conveyed away for homes, roads, and other surface improvements.

3.2.2 Drainage Design

Drainage areas within the project area will be determined. If possible, diversion ditches will be located in the upstream area in order to control and divert the drainage around the project area. All drainage ditches, swales, underdrains and culverts will be sized and designed in accordance with standard engineering practices. Size, slope, and lining of the proposed ditches and culverts will be specified on the plans and be based on required storm events. Design of drainage conveyances, including drainage channels, underdrains and /or other controls to safely convey water off-site will be designed in accordance with standard engineering practices and will fully consider the safety of the existing public dwellings and structures near the project areas. Hydrologic and hydraulic (H&H) analyses will be performed for the site and existing structures. The HydroCAD Stormwater Modeling program will be utilized in analyzing and sizing drainage structures for the project.

3.2.3 Access Road Design

Temporary and permanent access will be designed utilizing AutoCad software. Plan view, designed profile, and roadway cross sections shown at an appropriate interval will be prepared and will be included within the final drawing package. Typical sections will be shown to indicate design features such as roadway cross slopes, pavement composition (gravel, asphalt, or concrete) and thickness, side slopes of embankments/cut slopes and proposed ditching. The roadway will be designed in accordance with WVDEP mining and reclamation standards, or other standards as determined by WVDEP. Final design of the roadway will attempt to design the roadway to a balanced cut/fill situation, if possible. Cut and fill quantities will be listed on the plans.

3.3 MILLER MINE DRAINAGE

Located northeast of the town of Despard in Harrison County WV, at Summit Park Ballfield. The goal of this project is remediation of spoil/pond, a highwall, a dangerous slide, multiple subsidence areas, a collapsed portal, drainage design, removing dangerous existing structures and creation/upgrading the access roads to maintain above.

3.3.1 Remediation of spoil/pond

Impoundments will be dewatered in a controlled manner while also considering the safety of any existing public dwellings and structures downstream of the project areas and impacts to the receiving stream. Based upon the quality of the impounded water, some form of treatment may be necessary or required prior to discharge. Settling ponds, sumps and rock check dams will be positioned between the impoundment and the receiving stream as necessary. Following dewatering activities, the outside berms will be pushed and compacted in specified

lifts to final grade. All impacted areas will be revegetated according to the proposed seeding and revegetation plan.

3.3.2 Remediation of Highwall

Unless otherwise indicated, highwalls from former surface mining cuts or deep mine face up areas will be backfilled to approximate original contour using available onsite spoil materials. If inadequate spoil material remains or is available on the site, and alternate final grade may be proposed, or another source of material will be identified. Specifications will be developed indicating compaction requirements such as degree of compaction, lift thickness and other quality control parameters for compaction during highwall reclamation. If any highwalls have significant loose rock or other signs of instability, additional special requirements may be specified to provide for the safety of the contractor's employees and equipment during construction.

3.3.3 Slide Remediation

In order to develop the construction plans and technical specifications for slope stabilization, the development of a geotechnical investigation plan will be completed. The geotechnical investigation plan would consist of the drilling and sampling of soils in the vicinity of the landslide. Tetra Tech will provide a geotechnical engineer on site during the drilling operations. The number, locations, and depths of borings would be dependent on the extent and size of the landslide. In addition to the sampling of soils, the geotechnical boring plan would attempt to identify existing slip planes, the extent and locations of any perched aquifers as well as the elevation of phreatic surfaces at the completion of the drilling and 24 hours thereafter. Soil testing would be completed by Tetra Tech's in-house soil laboratory located in Morgantown, West Virginia. Potential soil tests and number of tests to be conducted would be determined following the geotechnical drilling and sampling operations but typically would include the following tests:

Potential Soil Tests

- Visual Description
- Grain Size Analyses
- Hydrometer Test
- Moisture Content
- Direct Shear
- Standard Proctor
- Atterberg Limits

Plan and cross section views will be developed for the design of the stabilization and remediation of the landslide area. Plan and cross section views will provide the location and design parameters of the final slope configuration and will show the location and details of proposed

subsurface drainage underdrains, final slopes, proposed keyways, and typical detail slope saw-cut excavation as part of the reconstructed/stabilized slope. Stability analyses will be completed utilizing the Slide 2 program to assist in determining the stable configuration of the final slope configuration with a minimum standard safety margin of 1.5. Specifications will be developed indicating compaction requirements such as degree of compaction, optimum moisture, plus or minus variance on moisture, lift thickness and other quality control parameters for compaction during construction.

3.3.4 Subsidence Remediation

A detailed analysis of the subsidence prone area will be performed. If necessary, subsidence modeling will be performed to ensure future subsidence is mitigated. Existing mine maps and other records will be evaluated. Exploratory drilling or geophysical techniques may be used to identify the location, extent, depth, and other information regarding the abandoned mine causing the mine subsidence issue. Plans for subsidence repair will be made for the unique ground conditions observed. Mine subsidence mitigation measures may include backfilling subsidence depressions and open caveholes, excavation and backfilling of mine voids, or drilling and grouting of mine voids.

3.3.5 Remediation of Mine Portal

Tetra Tech has extensive experience in the development and design of mine portal seals. Designs have included drilling from a location above and at an angle from the proposed seal and injecting designed grout to form the seal blockage and have also utilized polyurethane foam as a portal seal. This technique of designing and developing the portal seal has proven to be more effective and safer than excavating at the portal entry location and then constructing the concrete or concrete block portal seal. Each mine portal, whether open or collapsed, will be evaluated to determine the best method for reclamation. All However, mine portals will be sealed in accordance with WVDEP approved methods. If endangered species are present, such as various bat species, appropriate bat gates or other structures will be incorporated into the project design. Although it is Tetra Tech's understanding, based on information provided by Mike Sheehan, former WVDEP AML&R Program Administrator and current Tetra Tech employee, that the WVDEP's practice for mine openings is to presume presence of endangered bat species. Therefore, appropriate bat gates or other structures will be incorporated into the project design unless instructed otherwise by the WVDEP.

3.3.6 Drainage Design

Drainage areas within the project area will be determined. If possible, diversion ditches will be located in the upstream area in order to control and divert the drainage around the project area. All drainage ditches, swales, underdrains and culverts will be sized and designed in

accordance with standard engineering practices. Size, slope, and lining of the proposed ditches and culverts will be specified on the plans and be based on required storm events. Design of drainage conveyances, including drainage channels, underdrains and /or other controls to safely convey water off-site will be designed in accordance with standard engineering practices and will fully consider the safety of the existing public dwellings and structures near the project areas. Hydrologic and hydraulic (H&H) analyses will be performed for the site and existing structures. The HydroCAD Stormwater Modeling program will be utilized in analyzing and sizing drainage structures for the project.

3.3.7 Removal of Structures

Unless directed otherwise by the WVDEP any materials that can be safely and legally buried on-site will be disposed of in this manner, all other materials must be hauled to an appropriate landfill for disposal, weight tickets from the landfill will be required. Derelict equipment shall be hauled off-site and scrapped. If any structures contain asbestos, they will be evaluated in accordance with National Emission Standards for Hazardous Air Pollutants (NESHAP) standards and in accordance with any state or local requirements. Removal of asbestos will be completed in accordance with all safety precautions and requirements.

3.3.8 Access Road Design

Temporary and permanent access will be designed utilizing AutoCad software. Plan view, designed profile, and roadway cross sections shown at an appropriate interval will be prepared and will be included within the final drawing package. Typical sections will be shown to indicate design features such as roadway cross slopes, pavement composition (gravel, asphalt, or concrete) and thickness, side slopes of embankments/cut slopes and proposed ditching. The roadway will be designed in accordance with WVDEP mining and reclamation standards, or other standards as determined by WVDEP. Final design of the roadway will attempt to design the roadway to a balanced cut/fill situation, if possible. Cut and fill quantities will be listed on the plans.

3.4 SHINNSTON (SHEPPARD) MINE DRAINAGE

Located within the town of Shinnston in Harrison County WV. The goal of this project is remediation of a potentially large mine pool seeping into yards, a dangerous slide and drainage design.

3.4.1 Mine Pool Remediation

Any and all mine mapping and any available geographic information which is available will be compiled and analyzed. Additional geographic information may need to be collected to better understand the mine pool and the best ways to handle the mine pool seepage. Monitoring

wells may be installed to complete this task. Depending on the nature and depth of the mine pool a plan will be developed to best handle the water. Once detailed information on the nature and extent of the mine pool is determined, the pool may be managed and controlled via pumping, gravity drains, wet seals, horizontal and directional bores, or other means. In some cases, where there is little risk of mine pool blowout, seepage and drainage may be collected and conveyed away for homes, roads, and other surface improvements.

3.4.2 Slide Remediation

In order to develop the construction plans and technical specifications for slope stabilization, the development of a geotechnical investigation plan will be completed. The geotechnical investigation plan would consist of the drilling and sampling of soils in the vicinity of the landslide. Tetra Tech will provide a geotechnical engineer on site during the drilling operations. The number, locations, and depths of borings would be dependent on the extent and size of the landslide. In addition to the sampling of soils, the geotechnical boring plan would attempt to identify existing slip planes, the extent and locations of any perched aquifers as well as the elevation of phreatic surfaces at the completion of the drilling and 24 hours thereafter. Soil testing would be completed by Tetra Tech's in-house soil laboratory located in Morgantown, West Virginia. Potential soil tests and number of tests to be conducted would be determined following the geotechnical drilling and sampling operations but typically would include the following tests:

Potential Soil Tests

- Visual Description
- Grain Size Analyses
- Hydrometer Test
- Moisture Content
- Direct Shear
- Standard Proctor
- Atterberg Limits

Plan and cross section views will be developed for the design of the stabilization and remediation of the landslide area. Plan and cross section views will provide the location and design parameters of the final slope configuration and will show the location and details of proposed subsurface drainage underdrains, final slopes, proposed keyways, and typical detail slope saw-cut excavation as part of the reconstructed/stabilized slope. Stability analyses will be completed utilizing the Slide 2 program to assist in determining the stable configuration of the final slope configuration with a minimum standard safety margin of 1.5. Specifications will be developed indicating compaction requirements such as degree of compaction, optimum moisture, plus or minus variance on moisture, lift thickness and other quality control parameters for compaction during construction.

3.4.3 Drainage Design

Drainage areas within the project area will be determined. If possible, diversion ditches will be located in the upstream area in order to control and divert the drainage around the project area. All drainage ditches, swales, underdrains and culverts will be sized and designed in accordance with standard engineering practices. Size, slope, and lining of the proposed ditches and culverts will be specified on the plans and be based on required storm events. Design of drainage conveyances, including drainage channels, underdrains and /or other controls to safely convey water off-site will be designed in accordance with standard engineering practices and will fully consider the safety of the existing public dwellings and structures near the project areas. Hydrologic and hydraulic (H&H) analyses will be performed for the site and existing structures. The HydroCAD Stormwater Modeling program will be utilized in analyzing and sizing drainage structures for the project.

3.5 SIMPSON CREEK HIGHWALL, TIPPLE & PORTALS, PHASE II

Located southeast of the town of Galloway in Barbour County WV. The goal of this project is remediation multiple spoil piles, highwall, multiple dangerous slides, multiple open portals, a mine pool seeping into yards and basements, a couple clogged streams, trash removal & drainage design.

3.5.1 Remediation of Spoil/Refuse Piles

Reclamation of spoil and/or coal refuse piles will be designed in accordance with WVDEP mining and reclamation standards, or other standards as determined by WVDEP. Spoil and refuse material shall be regraded and capped with suitable soil found on-site. In the event a suitable soil cannot be found, a borrow area would need to be identified. This may be discussed during the pre-design meeting. Soil testing would be completed by Tetra Tech's in-house soil laboratory located in Morgantown, West Virginia. Alkaline addition may also be considered if desired by WV DEP to prevent or ameliorate AMD seeping or discharging from the refuse material. Necessary liming, soil supplements, and mulching requirements would be specified in the design to ensure adequate growth of vegetation following grading and seeding of the site.

3.5.2 Remediation of Highwall

Unless otherwise indicated, highwalls from former surface mining cuts or deep mine face up areas will be backfilled to approximate original contour using available onsite spoil materials. If inadequate spoil material remains or is available on the site, and alternate final grade may be proposed, or another source of material will be identified. Specifications will be developed indicating compaction requirements such as degree of compaction, lift thickness and other quality control parameters for compaction during highwall reclamation. If any highwalls have significant loose rock or other signs of instability, additional special requirements may be

specified to provide for the safety of the contractor's employees and equipment during construction.

3.5.3 Slide Remediation

In order to develop the construction plans and technical specifications for slope stabilization, the development of a geotechnical investigation plan will be completed. The geotechnical investigation plan would consist of the drilling and sampling of soils in the vicinity of the landslide. Tetra Tech will provide a geotechnical engineer on site during the drilling operations. The number, locations, and depths of borings would be dependent on the extent and size of the landslide. In addition to the sampling of soils, the geotechnical boring plan would attempt to identify existing slip planes, the extent and locations of any perched aquifers as well as the elevation of phreatic surfaces at the completion of the drilling and 24 hours thereafter. Soil testing would be completed by Tetra Tech's in-house soil laboratory located in Morgantown, West Virginia. Potential soil tests and number of tests to be conducted would be determined following the geotechnical drilling and sampling operations but typically would include the following tests:

Potential Soil Tests

- Visual Description
- Grain Size Analyses
- Hydrometer Test
- Moisture Content
- Direct Shear
- Standard Proctor
- Atterberg Limits

Plan and cross section views will be developed for the design of the stabilization and remediation of the landslide area. Plan and cross section views will provide the location and design parameters of the final slope configuration and will show the location and details of proposed subsurface drainage underdrains, final slopes, proposed keyways, and typical detail slope saw-cut excavation as part of the reconstructed/stabilized slope. Stability analyses will be completed utilizing the Slide 2 program to assist in determining the stable configuration of the final slope configuration with a minimum standard safety margin of 1.5. Specifications will be developed indicating compaction requirements such as degree of compaction, optimum moisture, plus or minus variance on moisture, lift thickness and other quality control parameters for compaction during construction.

3.5.4 Remediation of Mine Portals

Tetra Tech has extensive experience in the development and design of mine portal seals. Designs have included drilling from a location above and at an angle from the proposed seal

and injecting designed grout to form the seal blockage and have also utilized polyurethane foam as a portal seal. This technique of designing and developing the portal seal has proven to be more effective and safer than excavating at the portal entry location and then constructing the concrete or concrete block portal seal. Each mine portal, whether open or collapsed, will be evaluated to determine the best method for reclamation. All mine portals will be sealed in accordance with WVDEP approved methods. If endangered species are present, such as various bat species, appropriate bat gates or other structures will be incorporated into the project design. Although it is Tetra Tech's understanding, based on information provided by Mike Sheehan, former WVDEP AML&R Program Administrator and current Tetra Tech employee, that the WVDEP's practice for mine openings is to presume presence of endangered bat species. Therefore, appropriate bat gates or other structures will be incorporated into the project design unless instructed otherwise by the WVDEP.

3.5.5 Clogged Stream

An investigation of the length, volume and cause of the clogged stream will be conducted. Based on the results of this investigation a plan will be developed on the best method for removal of the material and subsequent disposal. Work in and around streams will be completed in accordance with all federal and state laws and regulations. Necessary permits would be applied for and all permit requirements would be incorporated into the design drawings and specifications. The goal of the remediation would be to restore stream channels to their pre-mining condition for both flow and function.

3.5.6 Mine Pool Remediation

Any and all mine mapping and any available geographic information which is available will be compiled and analyzed. Additional geographic information may need to be collected to better understand the mine pool and the best ways to handle the mine pool seepage. Monitoring wells may be installed to complete this task. Depending on the nature and depth of the mine pool a plan will be developed to best handle the water. Once detailed information on the nature and extent of the mine pool is determined, the pool may be managed and controlled via pumping, gravity drains, wet seals, horizontal and directional bores, or other means. In some cases, where there is little risk of mine pool blowout, seepage and drainage may be collected and conveyed away for homes, roads, and other surface improvements.

3.5.7 Trash Removal

Trash removal will be incorporated into the overall plans for the project and disposed of appropriately. Trash removed from the project site will be taken to an appropriate permitted landfill for disposal.

3.5.8 Drainage Design

Drainage areas within the project area will be determined. If possible, diversion ditches will be located in the upstream area in order to control and divert the drainage around the project area. All drainage ditches, swales, underdrains and culverts will be sized and designed in accordance with standard engineering practices. Size, slope, and lining of the proposed ditches and culverts will be specified on the plans and be based on required storm events. Design of drainage conveyances, including drainage channels, underdrains and /or other controls to safely convey water off-site will be designed in accordance with standard engineering practices and will fully consider the safety of the existing public dwellings and structures near the project areas. Hydrologic and hydraulic (H&H) analyses will be performed for the site and existing structures. The HydroCAD Stormwater Modeling program will be utilized in analyzing and sizing drainage structures for the project.

3.6 WEAVER PORTALS AND DRAINAGE PHASE III

Located southeast of the town of Junior in Barbour and Randolph Counties WV. The goal of this project is rehabilitation and/or replacement of an existing passive treatment system and installation of new treatment system.

3.6.1 Rehabilitation and/or replacement of Passive Treatment system

Tetra Tech would request and review all water sample and flow measurement information for the discharge being treated and for the effluent (and from individual treatment cells or components if available) from the current passive treatment system. If necessary additional sampling and monitoring may be recommended to develop the design flow and discharge water quality chemistry. Based on the design parameters, a new or upgraded passive treatment system would be designed using AMDTreat coupled with other design guidelines and Tetra Tech's past experience for similar sites. The redesigned passive treatment system will be evaluated for constructability on the site. If the available land area or topography is inadequate for the proposed system, other options may be proposed for review and approval by WV DEP. Plans for handling and disposal of any media such as spent limestone, compost, mulch or for any piping being replaced will be developed and incorporated into the project design West Fork #9 located in the town of Shinnston in Harrison County, WV. The goal of this project is for remediation of multiple open and collapsed portals, multiple subsidence areas, and drainage design.

3.6.2 Remediation of Mine Portals

Tetra Tech has extensive experience in the development and design of mine portal seals. Designs have included drilling from a location above and at an angle from the proposed seal and injecting designed grout to form the seal blockage and have also utilized polyurethane

foam as a portal seal. This technique of designing and developing the portal seal has proven to be more effective and safer than excavating at the portal entry location and then constructing the concrete or concrete block portal seal. Each mine portal, whether open or collapsed, will be evaluated to determine the best method for reclamation. All mine portals will be sealed in accordance with WVDEP approved methods. If endangered species are present, such as various bat species, appropriate bat gates or other structures will be incorporated into the project design. Although it is Tetra Tech's understanding, based on information provided by Mike Sheehan, former WVDEP AML&R Program Administrator and current Tetra Tech employee, that the WVDEP's practice for mine openings is to presume presence of endangered bat species. Therefore, appropriate bat gates or other structures will be incorporated into the project design unless instructed otherwise by the WVDEP.

3.6.3 Subsidence Remediation

A detailed analysis of the subsidence prone area will be performed. If necessary, subsidence modeling will be performed to ensure future subsidence is mitigated. Existing mine maps and other records will be evaluated. Exploratory drilling or geophysical techniques may be used to identify the location, extent, depth, and other information regarding the abandoned mine causing the mine subsidence issue. Plans for subsidence repair will be made for the unique ground conditions observed. Mine subsidence mitigation measures may include backfilling subsidence depressions and open caveholes, excavation and backfilling of mine voids, or drilling and grouting of mine voids.

3.6.4 Drainage Design

Drainage areas within the project area will be determined. If possible, diversion ditches will be located in the upstream area in order to control and divert the drainage around the project area. All drainage ditches, swales, underdrains and culverts will be sized and designed in accordance with standard engineering practices. Size, slope, and lining of the proposed ditches and culverts will be specified on the plans and be based on required storm events. Design of drainage conveyances, including drainage channels, underdrains and /or other controls to safely convey water off-site will be designed in accordance with standard engineering practices and will fully consider the safety of the existing public dwellings and structures near the project areas. Hydrologic and hydraulic (H&H) analyses will be performed for the site and existing structures. The HydroCAD Stormwater Modeling program will be utilized in analyzing and sizing drainage structures for the project.

12. A. Is your firm's personnel experienced in Abandoned Mine Lands Remediation/Mine Reclamation Engineering?

YES Description and Number of Projects: Tetra Tech has extensive experience with AML/Mine Reclamation Engineering. Tetra Tech is currently working on several AML projects in several states. Tetra Tech has also worked on AML related projects within the state of West Virginia. In the last 5 years Tetra Tech has performed 20+ of these types of projects.

B. Is your firm experienced in Soil Analysis?

YES Description and Number of Projects: Tetra Tech has a whole team dedicated to Geotechnical investigations including soil analysis. In the last 5 year this team has performed 20+ projects specifically associated with Soil Analysis.

C. Is your firm experienced in hydrology and hydraulics?

YES Description and Number of Projects: Tetra Tech has performed several projects looking at hydrology and hydraulics, specifically Tetra Tech specializes in mine pool analysis and AMD treatment systems. In the last 5 years Tetra Tech has performed 20+ projects looking at hydrology and hydraulics.

D. Does your firm produce its own Aerial Photography and Develop Contour Mapping?

YES Description and Number of Projects: Tetra Tech does produce its own Aerial Photography with the use of drone technology and we use that photography to develop contour mapping. We use this service across all disciplines and industries with hundreds of flights and maps developed on a yearly basis.

E. Is your firm experienced in domestic waterline design? (Include any experience your firm has in evaluation of aquifer degradation as a result of mining.)

YES Description and Number of Projects: Tetra Tech's large size and extensive resources provides for skilled individuals in various disciplines, Tetra Tech does have experience in domestic waterline design in conjunction with other projects.

F. Is your firm experienced in Acid Mine Drainage Evaluation and Abatement Design?

YES Description and Number of Projects: Tetra Tech has a whole team dedicated to Acid Mine Drainage projects, we are currently working on 12 projects specifically looking at AMD treatment with 10+ projects completed in the last 5 years.

13. PERSONAL HISTORY STATEMENT OF PRINCIPALS AND ASSOCIATES **RESPONSIBLE FOR AML PROJECT DESIGN** (Furnish complete data but keep to essentials)

NAME & TITLE (Last, First, Middle Int.) Cavazza, Eric E. P.E.	YEARS OF EXPERIENCE		
	YEARS OF AML DESIGN EXPERIENCE: 38	YEARS OF AML RELATED DESIGN EXPERIENCE:38	YEARS OF DOMESTIC WATERLINE DESIGN EXPERIENCE:

Brief Explanation of Responsibilities
 Mr. Eric Cavazza has over thirty-eight (38) years of extensive experience administering state and federal environmental programs including extensive experience managing the development, design and construction of environmental restoration projects to eliminate hazards and restore environmental degradation associated with abandoned mine lands. He served as the Design Section Chief in the PA AML Programs Cambria Office for 17 years, and served as Pennsylvania's AML Program Director for 9 years before retiring from there in December 2020.

EDUCATION (Degree, Year, Specialization)
 BS, 1983 Mining Engineer/ M Eng, 1995 Environmental Engineering

MEMBERSHIP IN PROFESSIONAL ORGANIZATIONS SME, ASRS	REGISTRATION (Type, Year, State) PE in PA (1989); PE in WV (2023); PE in KY (2023), PE in OH (2023), and PE in IN (2023)
---	---

13. PERSONAL HISTORY STATEMENT OF PRINCIPALS AND ASSOCIATES **RESPONSIBLE FOR AML PROJECT DESIGN** (Furnish complete data but keep to essentials)

NAME & TITLE (Last, First, Middle Int.) Hynes, Gregory PE	YEARS OF EXPERIENCE		
	YEARS OF AML DESIGN EXPERIENCE: 32	YEARS OF AML RELATED DESIGN EXPERIENCE:32	YEARS OF DOMESTIC WATERLINE DESIGN EXPERIENCE:

Brief Explanation of Responsibilities
 Mr. Hynes has 32 years of professional engineering experience including utility pipelines and abandoned mine land reclamation. Additionally, he has designed and permitted numerous mine surface facilities, oil and gas well pad sites, potable water distribution systems, stormwater conveyance systems, sanitary sewerage systems, and developed E&S control plans.

EDUCATION (Degree, Year, Specialization)
 BE, 1987 Civil Engineer/ MS, 1997 Civil Engineering

13. PERSONAL HISTORY STATEMENT OF PRINCIPALS AND ASSOCIATES **RESPONSIBLE FOR AML PROJECT DESIGN** (Furnish complete data but keep to essentials)

NAME & TITLE (Last, First, Middle Int.) Yost, Gregory P.G.	YEARS OF EXPERIENCE		
	YEARS OF AML DESIGN EXPERIENCE: 13	YEARS OF AML RELATED DESIGN EXPERIENCE: 13	YEARS OF DOMESTIC

Brief Explanation of Responsibilities
 Mr. Yost has experience with subsurface geotechnical investigations, including utilizing the information obtained to implement in foundation design. Additionally, Mr. Yost has construction experience comprising of well pads and compressor pads, pipeline right-of-way remediation, and landslide remediation. His experience also encompasses the evaluation of slope stability applied to cut slopes, fill slopes, and landslide susceptible slopes. Mr. Yost has experience analyzing rock formations for depositional environment, strike, dip, and rock structure including joints, faults, and discontinuities. Mr. Yost has experience with identifying and flagging wetland areas and performing investigation in determining contamination of both water and soil.

Trexler, Heather, PG	19	19	

Brief Explanation of Responsibilities

Ms. Trexler has over 18 years of professional experience with responsibilities for proposal preparation, staff oversight, job and budget tracking, technical report preparation, and client development for coal mining, natural gas and environmental projects. She is the Department Manager of the Energy and Natural Resources Group in the Pittsburgh office and leads projects requiring a multi-disciplinary team of professionals including engineering, geology, hydrogeology, and ecology. Projects activities for coal mining development include mine abandonment designs and the preparation of permits to state agencies in Pennsylvania and West Virginia for mine expansions and associated surface activities. Additional technical projects include the evaluation of current and potential mine pools and reviewing current and potential impacts to water resources.

19. Use this space to provide any additional information or description of resources supporting your firm's qualifications to perform work for the West Virginia Abandoned Mine Lands Program.
 Tetra Tech has extensive knowledge and vast resources to allow for a comprehensive approach to any problem. Tetra Tech works extensively with Abandoned Mine Lands and is well versed on solutions to any problem. Tetra Tech has a strong presence in West Virginia in Morgantown, Fairmont and Charleston, with offices in Pittsburgh, PA and St. Clairsville, OH regularly performing work in the state. The Tetra Tech Pittsburgh office has worked with WVDEP on several Special Reclamation projects throughout the state. Tetra Tech is also working on the design of AML projects with the PA, OH, and KY AML Programs.

20. The foregoing is a statement of facts.

I understand that failure to confirm the receipt of addenda may be cause for rejection of this bid. I further understand that any verbal representation made or assumed to be made during any oral discussion held between Vendor's representatives and any state personnel is not binding. Only the information issued in writing and added to the specifications by an official addendum is binding.
